SUMMARY

Final-year Computer Science Engineering student (graduating 2027) building backend systems in Python and FastAPI. Shipped two deployed APIs: a JWT authentication service and a Razorpay payments backend with transactional orders, idempotency and signed-webhook handling, backed by a pytest suite. Seeking Backend / Software Engineer roles and internships.

TECHNICAL SKILLS

Languages: Python, SQL, JavaScript, C
Backend & APIs: FastAPI, Flask, REST API design, JWT authentication, bcrypt, Pydantic, asyncpg, psycopg, webhooks, idempotency, rate limiting
Databases: PostgreSQL, SQLite, MongoDB, schema design, ACID transactions, connection pooling
Testing & Tools: pytest, Postman, Git, GitHub, Razorpay (test mode), Solidity (basic)
Deployment: Render, Neon (managed PostgreSQL), Vercel
Frontend (basic): HTML, CSS, JavaScript, React

PROJECTS

CartAPI: Orders & Payments Backend | *Python*, *FastAPI*, *PostgreSQL*, *psycopg*, *Razorpay*, *pytest* GitHub | Live API

- Built a layered REST API (routers, services, repositories) for catalog, orders and Razorpay test-mode payments; deployed on Render with Neon PostgreSQL.
- Made order creation atomic: stock decrement and order insert run in one transaction with a conditional update, so concurrent buyers cannot oversell; totals are computed server-side in integer paise.
- Implemented Idempotency-Key handling (pre-check plus a UNIQUE(user_id, key) constraint) so retries replay the original order; a concurrent-thread test confirms exactly one order is created.
- Secured payment webhooks with raw-body HMAC-SHA256 verification and constant-time comparison; duplicate events are rejected in the same transaction, amounts are validated, and orders only move forward in status.
- Wrote a pytest suite on an isolated Neon test database covering transactions, idempotency, signatures and webhook edge cases; verified the tests catch regressions by deliberately removing guards.

Authentication Service | *Python*, *FastAPI*, *PostgreSQL*, *asyncpg*, *JWT*, *bcrypt* GitHub | Live Demo

- Built signup, login, token-refresh and protected endpoints with bcrypt password hashing, short-lived JWT access tokens and validation middleware.
- Stored refresh tokens in PostgreSQL, added login rate limiting, and used an asyncpg connection pool with environment-based configuration.
- Deployed on Render with Neon PostgreSQL, with a lightweight HTML/CSS/JS client; its JWTs are verified by CartAPI, so the two services share one login.

Blockchain-Based Secure Online Examination System | *Python*, *Flask*, *SQLite*, *Solidity*, *ethers.js* GitHub

- Co-built (team of 2) a Flask exam platform with teacher and student roles, timed exams and automatic scoring; each result is sealed into a SHA-256 hash-linked chain, and a tamper-demo script shows edited records being detected.
- Wrote a Solidity contract (Ethereum Sepolia testnet, owner-only) that anchors result hashes, integrated via MetaMask and ethers.js for on-chain verification; only hashes are stored, never student data.

EDUCATION

B.E. Computer Science Engineering, MGM University (SOET), Chh. Sambhaji Nagar 2023 – 2027 | CGPA 7.29
HSC (XII), Maharashtra Board, 2023: 56% | SSC (X), Maharashtra Board, 2020: 89%

CERTIFICATIONS & TRAINING

- Forage job simulations (2026): JPMorgan Chase & Co. (Kafka, H2, REST API), Datacom (code review, bug fixing), Quantium
- Introduction to SQL, Simplilearn SkillUp, 2026

Languages: English, Hindi, Marathi
